Inference

Each year, billions of pounds of trash and other pollutants enter the ocean. Where does this pollution come from? Where does it go? Some of the debris ends up on our beaches, washed in with the waves and tides. Some debris sinks some is eaten by marine animals that mistake it for food, and some accumulates in ocean gyres. Other forms of pollution that impact the health of the ocean come from sources like oil spills or from accumulation of many dispersed sources, such as fertilizer from our yards.

**We initiate
Earth will appreciate**

The rest is actually great and intuitively follow the rules. The first version of this particular page which is infer necessarily changed due to chaotic image overload which might lead to further panic/anxiety attacks to viewer and bad grasp of color theory that makes the text difficult to read. We simply optimize it in a minimalism display and friendly to user with earth cursor highlight feature.
